

Evidence status against the paper's claims

Claim	Status	Current evidence
Policy executes width, DF and gait while walking straight	Supported	20/20 cells; 1,280/1,280 rollouts
Higher DF improves convergence	Diagnostic only	Periodicity: 61.25% at trot DF 0.50; 100% otherwise
Narrower stance worsens convergence	Missing	No valid χ -by-width comparison
Speed has weak convergence effect	Missing	0.25–0.40 m/s ran; χ invalid, so no usable comparison
Matched walk and trot converge similarly	Missing	No valid χ -by-gait comparison
DF and speed affect efficiency; gait is weak	Suppressed	65/80 valid CoT cells; missingness depends on factors
Width has little efficiency effect	Suppressed	Incomplete matched CoT pairs

Flat-ground, forward-only scope; nominal motor gains; one trained seed. χ claims require a valid estimator and independent policies.
